

CALSIM Water Resources Simulation Model

Modeling Support Branch
<http://modeling.water.ca.gov>
Office of SWP Planning
Department of Water Resources

What is a Water Resources System Model ?

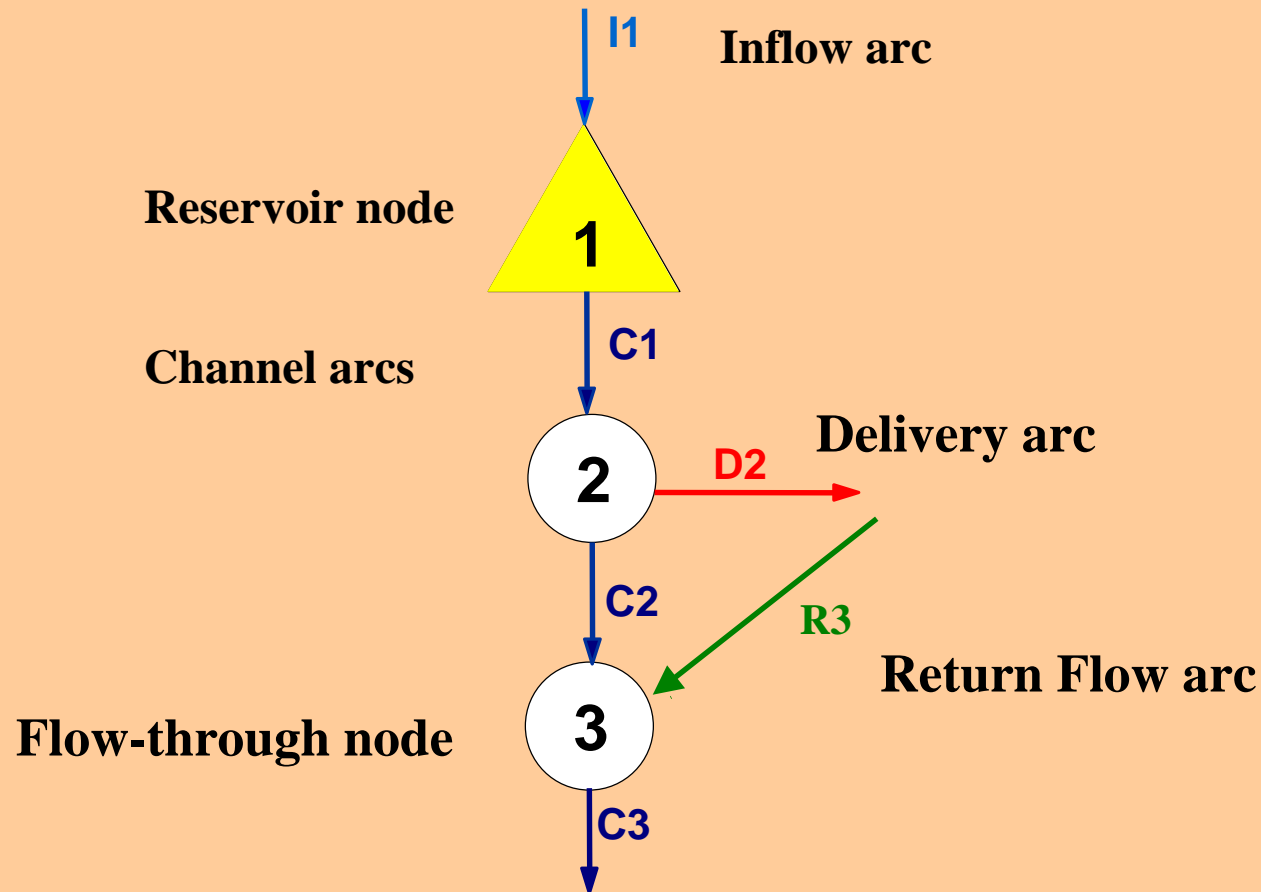

- Mathematical (numerical) representation of a real physical system (prototype)
- Represents relationships among the components of a real-world system.
- Used to evaluate the system response to a given hydrologic input, operational criteria and any proposed actions or facilities to evaluate “ what-if “ scenarios
- Necessarily a simplification of the system it describes. It would not be possible to construct a model that accounted for all the minute interactions of a complex system.

Model Description

- Water Resources Planning Model
- Network of nodes and arcs
- Graphical Interface
- LP solver for routing water
- WRESL language for specialized constraints
- Monthly/Daily timestep

System Representation

Role of CALSIM

- **Simulates Operations of SWP and CVP system facilities.**
- **Sacramento and San Joaquin River system and the Delta Operations.**
- **Accounts for system operational objectives, physical constraints, legal and institutional agreements and/or statutes.**
- **The model uses historical hydrological conditions, as modified, to reflect a given level of development.**

Current CALSIM Applications

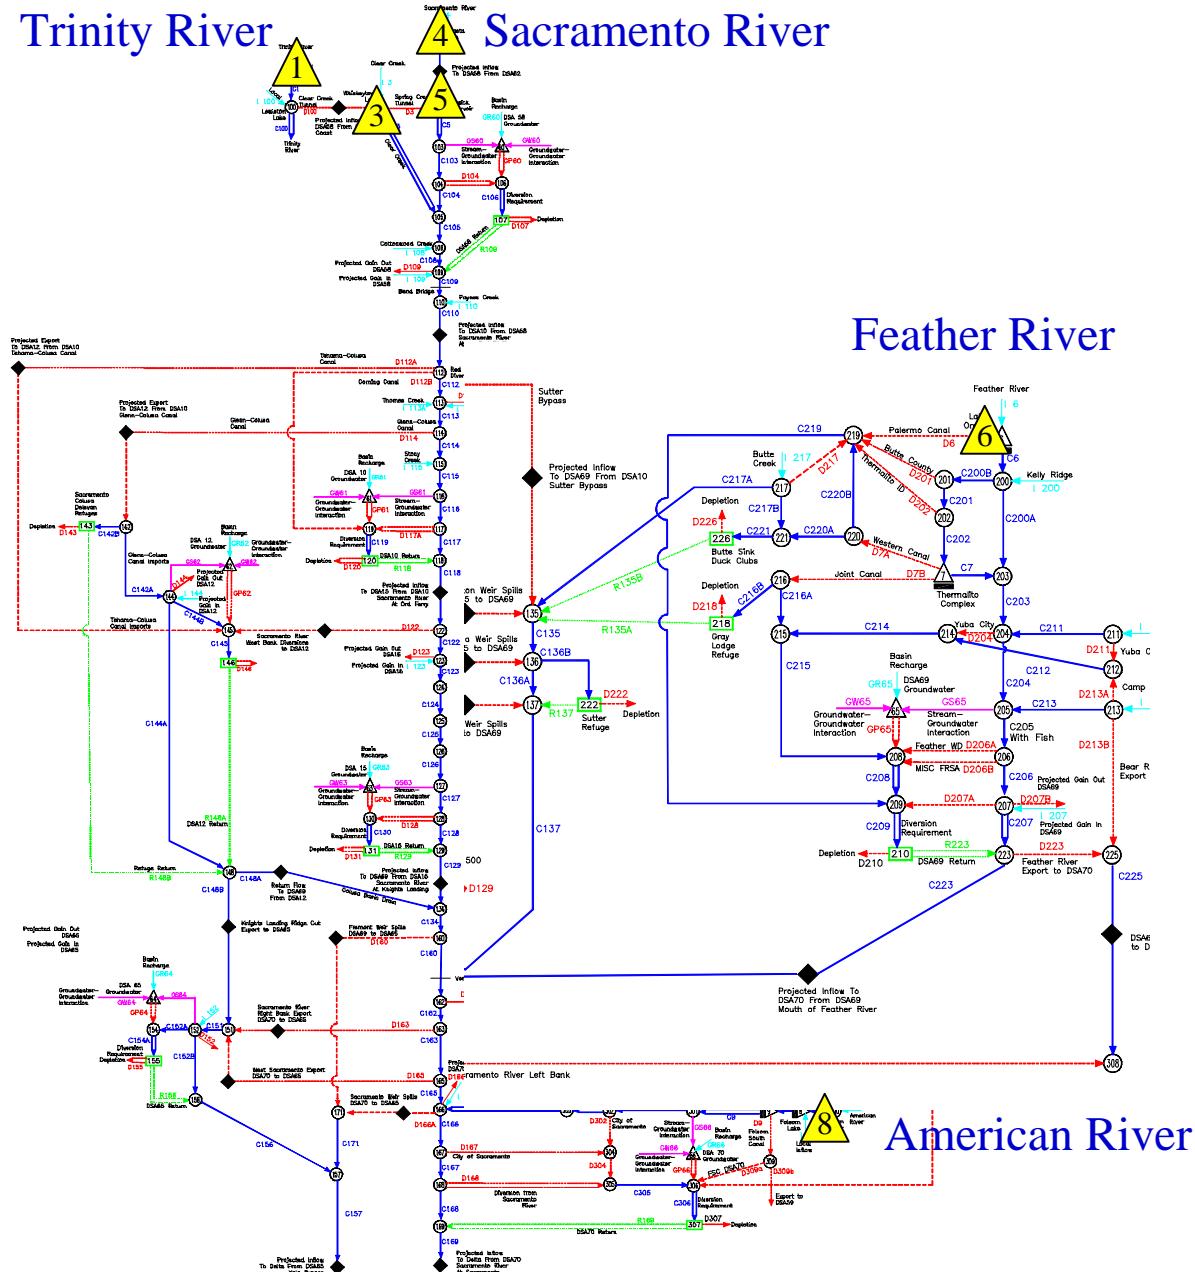

- CVP/SWP Water Supply Reliability Studies
- CALFED Bay-Delta Program
- CVPIA (b2) Evaluation
- SWRCB Water Rights Hearings Process
- CALFED ROD/EWA Operations
- Integrated Storage Investigations

Trinity River

Sacramento River

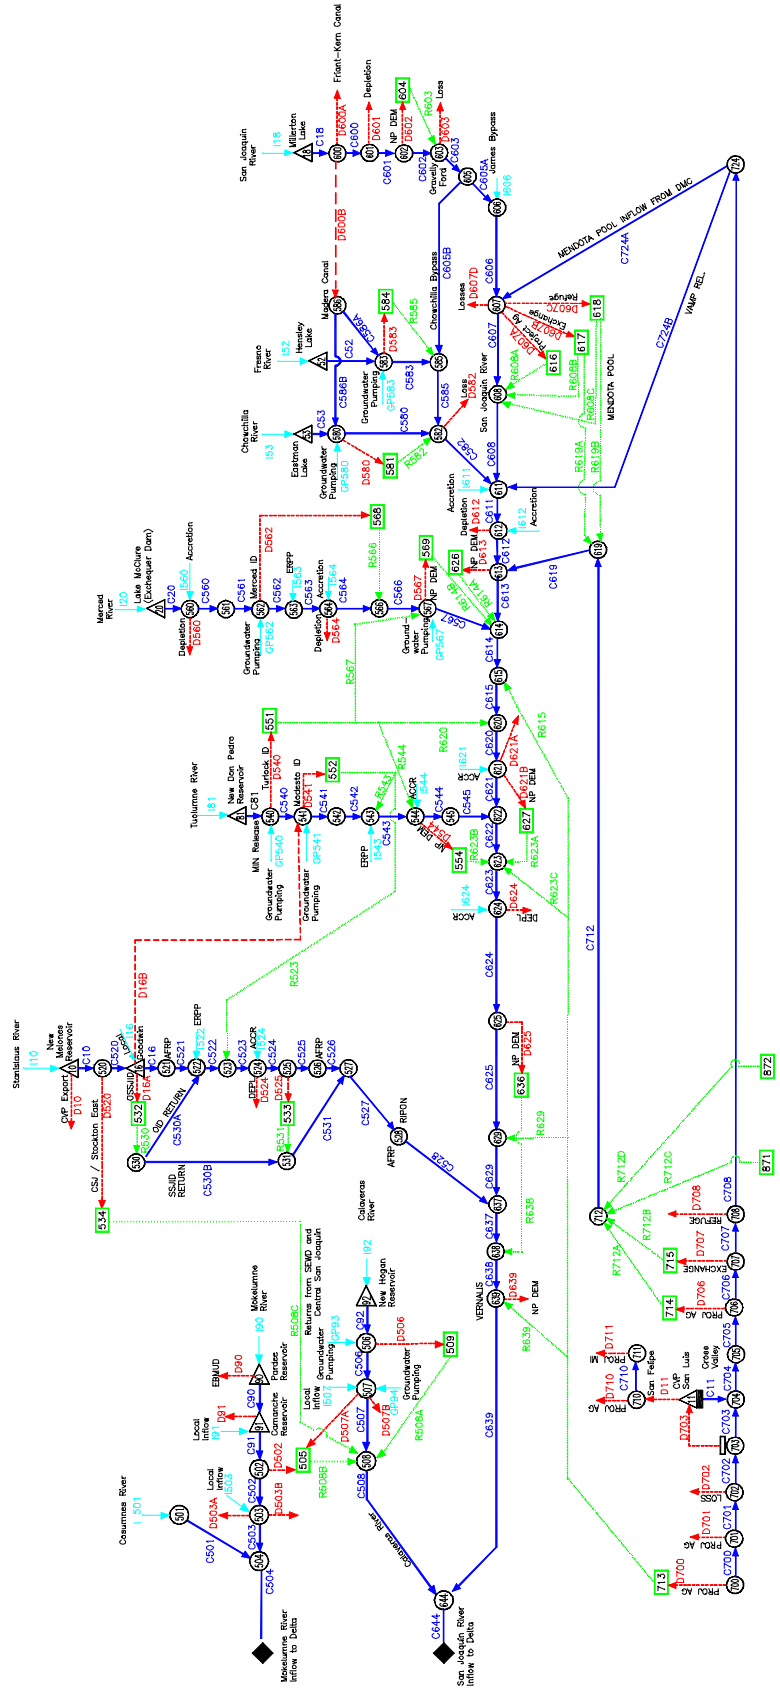

North

Feather River

American River

San Joaquin

[illegible]

Subsystem Isolation and Testing

Isolate component of interest by “cutting” free-body diagram

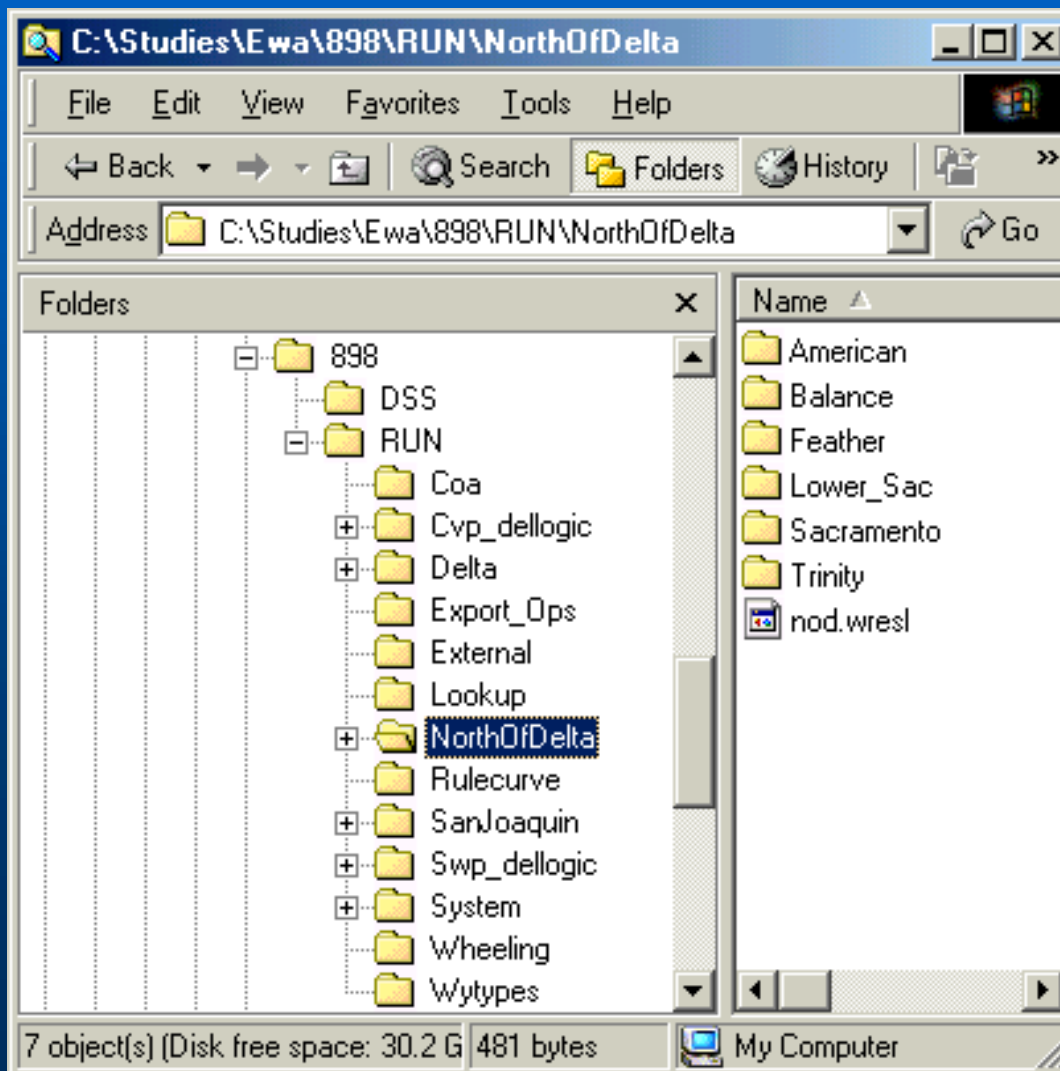

Fix flows, deliveries, or storages from other components to desired values

Test operation of isolated system in detail

CALSIM Highlights

- **Input-driven model**
- **Ease of changing rules/operations**
- **Modular**
- **Interactive - Computer Aided Negotiations (CAN)**

Modular Input Structure

- Organization of similar rules in same folders
- Separation of time-series and relational data
- Separation of external modules

Input/Output Analysis
